Ship a Claude or ChatGPT skill pack

Make Money Online with AI

THE OPERATOR BLUEPRINT

PATH 02

Ship a Claude or ChatGPT skill pack

They already pay the model. They are paying you to stop starting from zero.

Who this is for

People who use Claude, ChatGPT, or Gemini every week and keep rebuilding the same chat.

First sale

One \$19 order from someone who used the model this week.

Time to first

3–10 days

Cash window

\$19–\$39

Tools

Claude Projects or Custom GPTs, a zip of the skill files, a one-page install, Stripe.

Leave this alone

A 200-prompt dump with no job in the title. Competing with free GitHub lists on volume.

What a skill pack is

A skill pack is a working stack: instructions the model follows, examples of good output, and a way to install it in under ten minutes. It is not a PDF of prompts. It is closer to a small appliance. Plug it in, get the job.

The buyer has already decided AI is useful. Their pain is the blank window. Your job is to replace that window with a named job: weekly content, invoice follow-up, meeting notes into tasks, a listing description, a study plan.

If they cannot tell from the title what file they get and what job it does, they will not buy. 'Claude Power Pack' is a mood. 'Client follow-up skill for solo bookkeepers' is a product.

The first 72 hours

Pick one job you have done in a chat more than twice. Open a new project. Write the system instructions as if you will never be in the room: role, inputs they must paste, output format, quality checks, what to ask if information is missing.

Run it on a real example. Save the output as the sample. Write a one-page install: where to click, what to paste, how to test. Zip it. Price \$19. Record a 20-second screen: blank chat versus the skill.

Put the video and the checkout in one place. Ask five people who already use Claude or ChatGPT. Do not explain the catalog of other ideas you have.

- One job, written as system instructions
- One real example output in the zip
- One-page install a tired person can follow
- Twenty-second screen recording
- Five asks, not fifty features

The path, step by step

Step 1. Watch how the buyer actually works. If they live in email, do not build a Notion skill.

Step 2. Write the skill so the first message from the user is just the raw material. The skill should not need a prompt engineer on their side.

Step 3. Add failure modes: 'If the invoice amount is missing, ask once, then stop.' Silent guessing is how people lose trust.

Step 4. Version the file. `v1` is allowed to be narrow. You will ship `v1.1` after the first buyer.

Step 5. Package: README, skill or instructions file, sample input, sample output. That is enough.

Step 6. Checkout title is the job. Thumbnail is the screen recording still.

Step 7. Sell where those users already complain: X threads, Reddit help posts, Discord. Help first. Link in profile.

Step 8. After purchase, a three-line email: install, test with the sample, reply if it breaks. That reply is your product roadmap.

Copy

Post: 'I wasted two hours prompting this. The skill does it in one paste. \$19.'

Reply under other people's Claude threads: show the result, not the pitch. Profile holds the link.

Listing: 'Install in 10 minutes. Built for [job]. Not a prompt dump.'

Week-by-week

Day 1–2: write and test the skill on a real job. Day 3: package and checkout. Day 4–7: five asks plus one screen recording posted once a day.

Week 2: fix whatever the first buyer could not install. Ship `v1.1`. Do not add a second skill until this one has a stranger sale.

Mistakes

Shipping prompts without install steps. Promising it works on every model. Bundling 40 jobs so none of them are good. Using other people's copyrighted prompt packs as your file.

Close the book. Do the first 72 hours. Do not tour the rest tonight.
